IQR

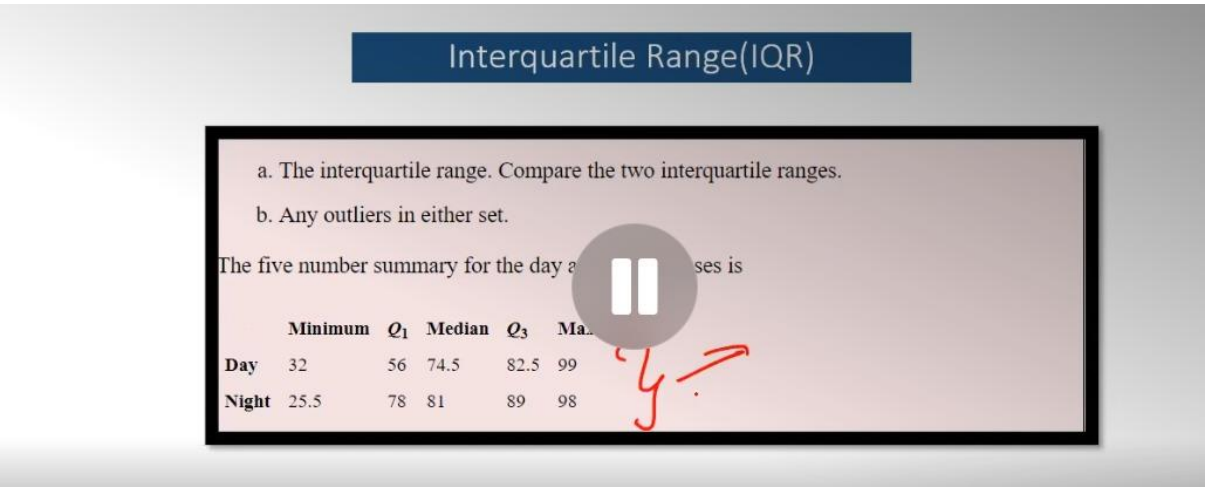

IQR (Interquartile Range) in Machine Learning is a statistical measure used to identify **outliers** in a dataset and understand the spread of data.

$$IQR=Q3-Q1$$

$$Lower=Q1-1.5(IQR)$$

$$Upper=Q3+1.5(IQR)$$

We use 1.5 times IQR as a standard statistical rule to identify potential outliers. It provides a reasonable balance between detecting unusual values and avoiding too many false alarms

Day:

IQR = Q3 – Q1 = 26.5

Lesser = Q1 – 1.5*IQR = 16.25

Greater = Q3 + 1.5*IQR = 122.25

32 < 16.25 (No Lesser outlier present)

99 > 122.25(No Greater outlier present)

Night:

IQR = Q3 – Q1 = 11

Lesser = Q1 – 1.5*IQR = 61.5

Greater = Q3 + 1.5*IQR = 105.5

25.5 < 61.5 (No Lesser outlier present)

98 > 105.5(No Greater outlier present)
